

01

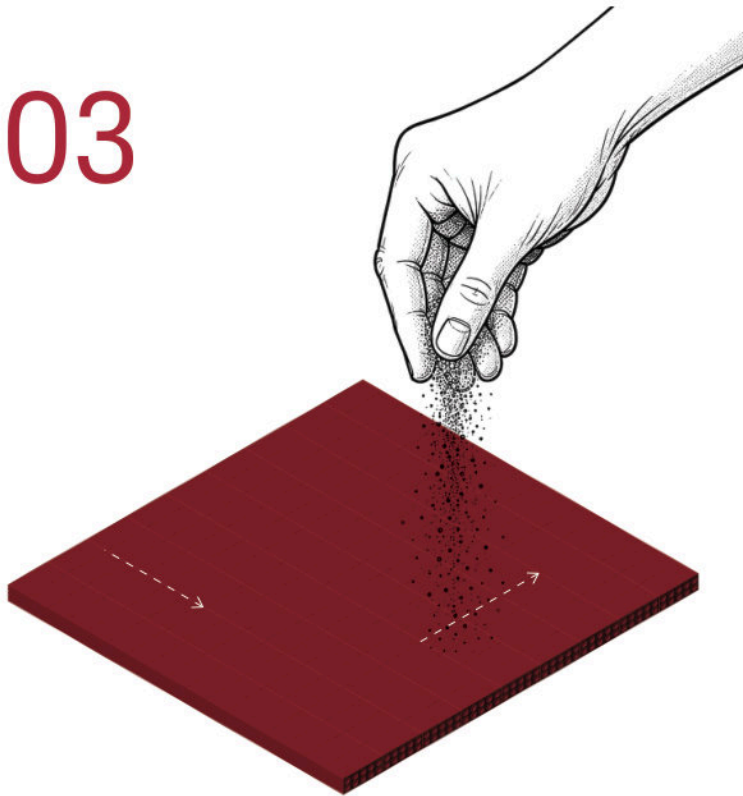

How to Build A Stepped Playground

02

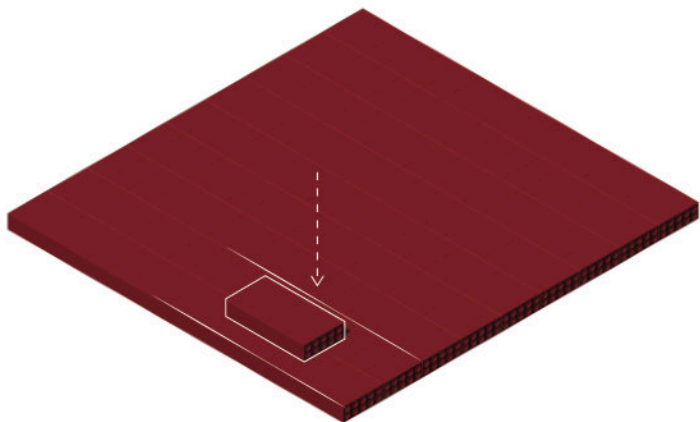

Arrange the bricks in an **L-shape** on the ground, starting from the corner and working outward along each side until the desired length and width are reached. Make sure every brick faces the same direction throughout, do not rotate or flip any of them.

03

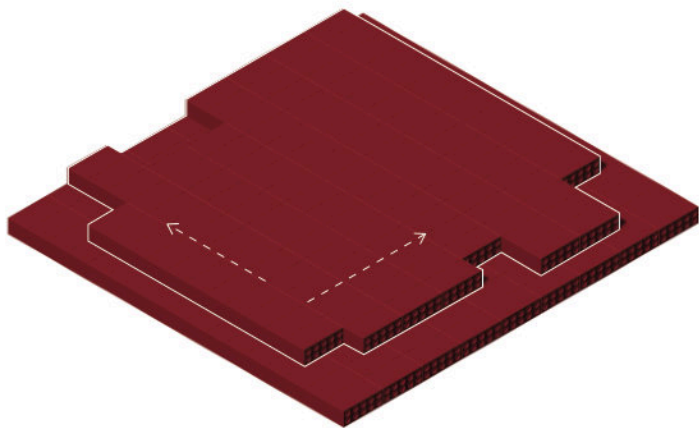

Complete the rest of the rectangle by filling in the remaining space with bricks. Once all bricks are in place, sprinkle **sand** over the surface and brush it into the gaps between the bricks for stability. Sweep off any excess sand from the top of the bricks once done.

04

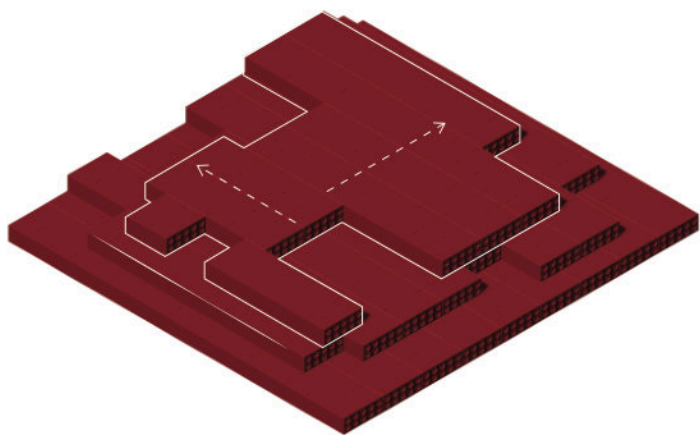

For the upper layer, place each brick so that its middle lines up with the edge of the brick below it, creating a **staggered pattern**.

05

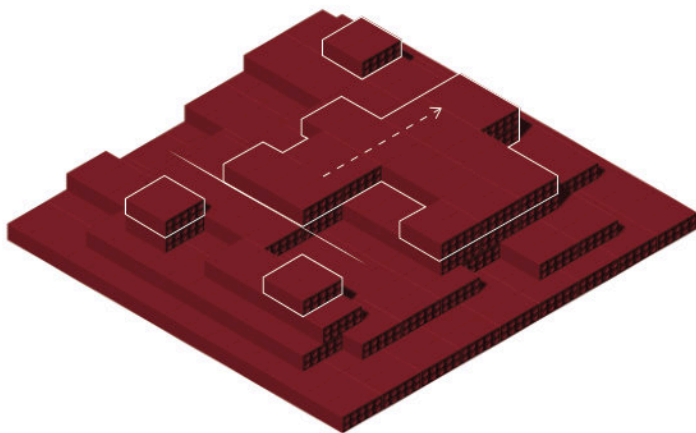

Continue stacking bricks in the same staggered pattern until the second layer reaches your desired configuration.

06

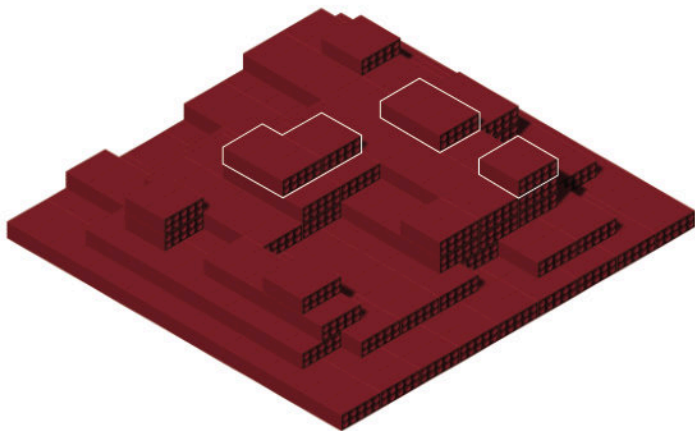

Repeat the same process for the third layer. Not every brick from the lower layer needs to continue upward, but every upper brick must always rest on and overlap the bricks below for stability.

07

From the fourth layer onward, the staggered pattern is no longer needed, simply stack each brick directly on top of the one below it.

08

Continue laying the bricks till you reach your desired configuration!
